| **Referred By:** | د/ هيفاء الكبسي | | | **Reported date:** | 2026-03-10 |

## PATHOLOGY REPORT

| | |
|---|---|
| **Clinical Information.** | ?A primigravid patient who is post-cesarean section performed due to fetal distress, with a specimen sent for histopathology. |
| **Nature of specimen.** | Uterine contents |

### GROSS:

Bloody soft tissue fragments collectively measured 4x3x1 cm, totally embedded.

### MICROSCOPIC:

Placental tissue composed of chorionic villi and decidua, predominantly characterized by massive, widespread acute hemorrhage and dense fibrin deposition that extensively disrupts the decidual stroma and intervillous spaces. The involved decidua exhibits significant ischemic necrosis and structural degeneration secondary to the bleeding. Adjacent chorionic villi show focal ischemic changes, compression, and varying degrees of degeneration. There is no evidence of severe acute chorioamnionitis or gross morphological anomalies in submitted material.

### DIAGNOSIS:

***Uterine contents:***

- **Placental tissue exhibiting massive acute hemorrhage and decidual necrosis, consistent with abruptio placentae (retroplacental hematoma).**

***Pathologist***
