PATHOLOGY REPORT

Clinical Information.	Penile skin lesion.
Nature of specimen.	Excision biopsy

GROSS:

One skin ellipse measured 0.9x0.8x0.6 cm, showing cyst 0.8x0.7 cm

MICROSCOPIC:

Sections show a well-circumscribed dermal cyst lined by stratified squamous epithelium with a distinct granular layer. The cystic cavity is filled with lamellated keratin. The surrounding stroma and overlying epithelium are unremarkable, with no evidence of atypia, inflammation, or malignancy.

DIAGNOSIS:

Penile skin lesion, Excision Biopsy:

- Epidermal inclusion cyst (Epidermoid cyst).
- Negative for malignancy.
