## PATHOLOGY REPORT

<b>Clinical Information.</b>	Severe erosive and hemorrhagic gastritis with diffuse, predominantly fundic, gastric polyps.
<b>Nature of specimen.</b>	Endoscopic biopsies.

### GROSS:

Soft tissue fragments collectively measured 1 cm, totally embedded.

### MICROSCOPIC:

The gastric mucosa exhibits a polypoid architecture with focal cystic dilatation of fundic glands and reactive foveolar hyperplasia. The surface demonstrates extensive erosions, fibrinopurulent exudate, and prominent hemorrhage. The lamina propria is expanded by a dense mixed inflammatory infiltrate showing neutrophilic infiltration of the epithelium. *Helicobacter pylori* are identified within the surface mucus and gastric pits. No intestinal metaplasia or dysplasia is identified.

### DIAGNOSIS:

#### Stomach, endoscopic biopsy:

- Active inflammatory ulceration with chronic *H. pylori*-associated gastritis, moderate inflammatory activity and associated fundic gland polyps.
- Negative for intestinal metaplasia, dysplasia or malignancy.
