PATHOLOGY REPORT

Clinical Information.	Gall bladder stones
Nature of specimen.	Cholecystectomy

GROSS:

Gall bladder received open measuring 6x2.5 cm, showing ulcerated mucosa and thickened wall up to 0.3 cm, full of multiple stones.

MICROSCOPIC:

Gall bladder wall shows moderate fibrosis and focally ulcerated mucosal lining with related moderate to focally marked infiltrate of lymphocytes, plasma cells and abundant foamy histiocytes. Such infiltration is extending to peri-cholecystic fat with related vascular congestion and interstitial hemorrhage. Glands exhibit focal cystic dilatation and appear to be entrapped within muscular coat (Rokitansky-Aschoff sinuses). No evidence of atypia or malignancy.

DIAGNOSIS:

Gall bladder, cholecystectomy:

- Chronic calcular cholecystitis.
- Negative for malignancy.
