PATHOLOGY REPORT

Clinical Information.	Circumferential mass lesion in the ascending colon that is causing luminal obstruction.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Soft tissue fragments collectively measured 1.2 cm, totally embedded.

MICROSCOPIC:

Sections show a moderately differentiated adenocarcinoma composed of infiltrating, irregular glands and cribriform nests characterized by back-to-back growth and intraluminal dirty necrosis. The malignant cells exhibit significant nuclear pleomorphism, hyperchromasia, and frequent mitoses, all set within a dense desmoplastic stroma. Foci of necrosis are noted.

DIAGNOSIS:

Ascending Colon, Biopsy:

- Adenocarcinoma, Moderately Differentiated.
