PATHOLOGY REPORT

Clinical Information.	Appendiceal mass.
Nature of specimen.	Appendicectomy

GROSS:

?The specimen consisted of an appendix measuring 6 x 1 cm with attached fat measuring 7 x 2.5 cm. Examination revealed a grey, ulcerated area that is suspicious for a mass lesion, measuring 4 x 0.8 cm, and the appendiceal wall thickness measured 0.4 cm.

MICROSCOPIC:

Appendicular lumen is full of neutrophils that extend into wall in between the mucosal associated lymphoid tissue together with lymphocytes and plasma cells. Such infiltrate extends to periappendicular fat forming abscess formation. Impacted fecolith is noted. No evidence of specific granulomas. No evidence of appendicular tumors.

DIAGNOSIS:

Appendicectomy:

- Acute (suppurative) on top of chronic appendicitis with periappendicitis and abscess formation.
- Negative for malignancy.
