PATHOLOGY REPORT

Clinical Information.	Epigastric pain and anemia two months post-cholecystectomy, who underwent an upper GI endoscopy that appeared macroscopically normal but required duodenal biopsies to rule out villous atrophy.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Soft tissue fragments collectively measured 0.5 cm, totally embedded.

MICROSCOPIC:

Duodenal mucosa shows focal moderate villous atrophy associated intraepithelial lymphocytosis and crypt hyperplasia with submucosal mild infiltrate of lymphocytes and plasma cells. No evidence of specific granulomas. No evidence of atypia or malignancy.

DIAGNOSIS:

Duodenal endoscopic biopsy:

- Focal moderate villous atrophy with associated chronic non-specific duodenitis, consistent with celiac disease.
- Modified Marsh-Oberhuber classification, grade 3a (Corazza & Villanacci grade B1).
- Negative for malignancy.
