Pt. Age:	50 years	Gender:	Female
Received date:		Reported date:	2026-01-09
Referred By:	د/ نيفين نجيب الميسري		

PATHOLOGY REPORT

Clinical Information.	Generalized plaque with ulceration.
Nature of specimen.	Skin biopsy.

GROSS:

Four skin ellipses collectively measured 1x0.7x0.3 cm, totally embedded.

MICROSCOPIC:

Serial sections show focal subcorneal clefting of epidermis with associated moderate dermal perivascular inflammatory infiltrate formed of lymphocytes, plasma cells and eosinophils. No evidence of specific granulomas. Picture consistent with pemphigus foliaceus.

DIAGNOSIS:

Skin biopsies:

- Consistent with pemphigus foliaceus.
- Negative for malignancy.
