<b>Referred By:</b>	د/ عقيل الشامي		<b>Reported date:</b>	2026-03-12	

### PATHOLOGY REPORT

<b>Clinical Information.</b>	Patient presenting with bloating and positive TTG IgG antibodies underwent a gastroscopy that revealed mild pangastritis, with duodenal biopsies currently pending to rule out villous atrophy (celiac disease).
<b>Nature of specimen.</b>	Endoscopic biopsy.

#### GROSS:

Two soft tissue fragments collectively measured 0.5 cm, totally embedded.

#### MICROSCOPIC:

Duodenal mucosa show focal moderate villous atrophy associated intraepithelial lymphocytosis and crypt hyperplasia with submucosal mild infiltrate of lymphocytes and plasma cells. No evidence of specific granulomas. No evidence of atypia or malignancy.

#### DIAGNOSIS:

##### Duodenum, endoscopic biopsy:

- Focal moderate villous atrophy with associated chronic non-specific duodenitis, consistent with celiac disease.
- Modified Marsh-Oberhuber classification, grade 3a (Corazza & Villanacci grade B1).
- Negative for malignancy.
