Pt. Age:	45 years.	Gender:	Female	Received date:	2026-03-10
Referred By:	د / سعود		Reported date:	2026-03-14	

PATHOLOGY REPORT

Clinical Information.	Right-sided Bartholin's gland cyst.
Nature of specimen.	Excision biopsy

GROSS:

Two soft tissue fragments collectively measured 2x1.3x0.8 cm, totally embedded.

MICROSCOPIC:

A well-circumscribed, nodular neoplasm composed of intersecting fascicles of bland, uniform spindle cells with wavy nuclei and pale cytoplasm. The lesion exhibits a biphasic architecture with alternating hypercellular zones and loosely textured myxoid areas, with formation of Verocay bodies. The intervening stroma contains dense collagen and prominent thick-walled, hyalinized blood vessels. There is no cytological atypia, tumor necrosis, or significant mitotic activity.

DIAGNOSIS:

Vulval cystic lesion, excision:

- Schwannoma, with secondary cystic change.
- Negative for malignancy.
