PATHOLOGY REPORT

Clinical Information.	Ovarian cyst and a specimen from the peri-umbilical area.
Nature of specimen.	Excision

GROSS:

The specimen consists of an intact ovarian cyst measuring 4 x 3 x 3 cm, with an attached fallopian tube measuring 2.3 cm. The cyst exhibits a smooth outer surface and is filled with gelatinous material. Additionally received is a separate, single fragment of soft fatty tissue measuring 5 x 3.5 x 2 cm, which is partially covered by skin. Sectioning reveals a fatty cut surface.

MICROSCOPIC:

Fibrotic cyst wall showing coverage by non-mucigenic cuboidal cells. No evidence of epithelial piling up or stromal invasion. No evidence of atypia or malignancy.

A benign non-capsulated soft tissue tumor formed of lobules of mature fat cells separated by delicate fibrovascular trabeculae. Areas of fat necrosis and fibrosis are seen. No evidence of malignancy.

DIAGNOSIS:

Ovarian cystectomy:

- Simple serous cyst.
- Negative for malignancy.

Periumbilical lesion, excision:

- Lipoma with focal fat necrosis and fibrosis.
- Negative for malignancy.
