PATHOLOGY REPORT

Clinical Information.	Left breast mass, suspected fibroadenoma.
Nature of specimen.	Excision biopsy.

GROSS:

Soft tissue mass measured 7 x 5.5 x 4.8 cm, showing rubbery creamy solid firm area measuring 6 x 5 x 4.5 cm, having solid rubbery whitish cut section.

MICROSCOPIC:

Sections from the mass revealed an invasive carcinoma formed of irregular groups and sheets of large malignant cells exhibiting rare ductal differentiation. Anaplasia and mitosis are marked and stromal fibrosis is mild with associated dense lymphoplasmacytic infiltrate. No evidence of surrounding tissue clearance. No evidence of lymphovascular or perineural invasion.

DIAGNOSIS:

Breast mass, excision biopsy:

- Invasive carcinoma with medullary features, grade 3.
- No evidence of lymphovascular or perineural invasion.
- No evidence of surrounding tissue clear margins.
