Pt. Age:	40 years.	Gender:	Female
Received date:		Reported date:	2026-01-10
Referred By:	د/ عائشة غالب		

PATHOLOGY REPORT

Clinical Information.	Placenta of abortion.
Nature of specimen.	Uterine contents

GROSS:

Two bloody soft tissue pieces measured 3x2x1.3 cm and 2.3x1.8x1 cm, both were totally embedded.

PHOTOGRAPH

MICROSCOPIC:

Maternal surface of placenta shows a hematoma with related ischemic necrosis of chorionic villi, indicating placental insufficiency due to focal premature placental separation as a result of hemorrhage. However, no evidence of calcification, villitis or amnionitis. The overall picture is consistent with uteroplacental insufficiency due to placental separation.

DIAGNOSIS:

Uterine contents:

- Uteroplacental insufficiency due to premature placental separation as a result of hemorrhage.
- No evidence of infectious or inflammatory placental pathology
