PATHOLOGY REPORT

Clinical Information.	Cystic lesion attached to small bowel, suspected of mesenteric cyst.
Nature of specimen.	Cystectomy.

GROSS:

Intact cyst measured 6x5.5x5 cm, having smooth outer surface and filled with yellowish fluid.

MICROSCOPIC:

The cyst wall is composed predominantly of dense fibrocollagenous connective tissue intermixed with intersecting bundles of smooth muscle. The internal lining of the cyst appears largely attenuated or denuded, lacking a well-preserved, epithelial layer. The underlying stroma contains scattered small blood vessels and focal mild chronic inflammatory cells. There is no evidence of nuclear atypia, mitotic activity, necrosis, or malignancy.

DIAGNOSIS:

Small Bowel related cystic lesion, Excision:

- Mesenteric cyst.
- Negative for malignancy.
