PATHOLOGY REPORT

Clinical Information.	Empyema.
Nature of specimen.	Biopsy

GROSS:

Soft tissue fragments collectively measured 5.5x5x1 cm, totally embedded.

MICROSCOPIC:

Fibrotic pleura with extensively ulcerated mesothelium and replacement by fibrinous deposits, capillary proliferation, interstitial hemorrhage and marked infiltration by lymphocytes, plasma cells and many neutrophils, cell debris with and related dense fibrosis. No evidence of granulomatous inflammation. No evidence of malignancy.

DIAGNOSIS:

Pleural, biopsy:

- Chronic suppurative inflammation (empyema) with fibrosis.
- Negative for specific granulomas.
- Negative for malignancy.
