PATHOLOGY REPORT

Clinical Information.	Terminal ileitis, characterized by patches of hyperemia and edema.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Two soft tissue fragments collectively measured 0.4 cm, totally embedded.

MICROSCOPIC:

Ileal mucosa showing hyperplasia of the mucosal-associated lymphoid tissue with intervening infiltration by lymphocytes and plasma cells. Villi are intact and are negative for atrophy and ulceration. No evidence of malignancy.

DIAGNOSIS:

Terminal ileum, endoscopic biopsy:

- Mild chronic non-specific ileitis with associated reactive lymphoid hyperplasia.
- Negative for malignancy.
