Referred By:	د / عقيل الشامي		Reported date:	2026-04-02	

PATHOLOGY REPORT

Clinical Information.	Terminal ileal narrowing and a circumferential ulcer.
Nature of specimen.	Endoscopic biopsy

GROSS:

Soft tissue fragments collectively measured 0.7 cm, totally embedded.

MICROSCOPIC:

Ileal mucosa showing focally ulcerated mucosa with related capillary proliferation and dense infiltration by neutrophils, plasma cells and lymphocytes. In non-ulcerated areas, villi are intact and are negative for atrophy. No evidence of specific granulomas. No evidence of malignancy.

DIAGNOSIS:

Terminal ileum, biopsy:

- Moderate chronic non-specific ileitis with focal active ulceration.
- Negative for atypia and malignancy.
