PATHOLOGY REPORT

Clinical Information.	Displaced, comminuted right femoral neck fracture and MRI findings highly suggestive of acute osteomyelitis involving the proximal femur, likely occurring on a background of prior chronic bone and joint infections.
Nature of specimen.	Excision biopsy.

GROSS:

Bone fragments collectively measured 1.3x1x0.7cm, totally embedded.

MICROSCOPIC:

Submitted bony fragments show dense infiltration by neutrophils, lymphocytes, plasma cells, and macrophages with related capillary proliferation. No evidence of specific granulomas. No evidence of malignancy.

DIAGNOSIS:

Pathological fracture of proximal femur, Excision biopsy;

- Chronic suppurative osteomyelitis extending to surrounding soft tissues.
- Negative for malignancy.
