PATHOLOGY REPORT

Clinical Information.	History of a benign granulomatous urinary bladder mass resected via TURBT in 2024 presented with recurrent symptoms and ultrasound findings of a similar polypoid structure.
Nature of specimen.	TUR of bladder being looking lesion.

GROSS:

Two soft tissue fragments collectively measured 1x0.8x0.7 cm, totally embedded.

MICROSCOPIC:

Polypoid mucosal fragments exhibit marked stromal edema and a chronic non-specific inflammatory infiltrate of lymphocytes and plasma cells. Proliferative Brunns' nests are prominent within the lamina propria, showing transformation into cystitis cystica and cystitis glandularis with mucinous metaplasia. The lining epithelium is cytologically bland, lacking atypia, pleomorphism, or increased mitotic activity. No granulomas or features of malignancy are observed.

DIAGNOSIS:

Urinary Bladder Lesion, TUR:

- Chronic non-specific polypoid cystitis with cystitis cystica et glandularis.
- Negative for malignancy.
