Pt. Age:	40 years.	Gender:	Male	Received date:	2026-04-06
Referred By:	د/ عقيل الشامي		Reported date:	2026-04-08	

PATHOLOGY REPORT

Clinical Information.	Erosive proctosigmoiditis.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Soft tissue fragments collectively measured 1 cm, totally embedded.

MICROSCOPIC:

Colonic mucosa showing focal superficial erosion with mild reduction in the number of mucigenic cells and moderate infiltration by lymphocytes, plasma cells and neutrophils. However, crypt abscesses are not identified. No evidence of atypical or malignant cells.

DIAGNOSIS:

Rectosigmoid, colonoscopic biopsy:

- Moderate chronic proctosigmoiditis with inflammatory activity and focal superficial erosion.
- Negative for atypia and malignancy.
