PATHOLOGY REPORT

Clinical Information.	Marked gastric nodularity.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Soft tissue fragments collectively measured 0.7 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa showing focal erosion, mild atrophy of glands and moderate infiltration by lymphocytes and plasma cells. Lymphocytes aggregate in some foci to form lymphoid follicles with active germinal centers. Neutrophils are seen infiltrating glands thus indicating activity. H. pylori characteristic forms are seen colonizing glands. No evidence of intestinal metaplasia, atypia or malignancy. Since cytotoxin-producing H. pylori are capable of inducing complications, their serological detection is recommended.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- H. pylori-associated chronic follicular gastritis with mild glandular atrophy and moderate inflammatory activity.
- Negative for malignancy.
