Received date:		Reported date:	2026-01-12
Referred By:	د/ رولا الفيل		

PATHOLOGY REPORT

Clinical Information.	Lower back mass.
Nature of specimen.	Excision.

GROSS:

Two soft tissue fragments, the first measured 2.5X2X1.5 cm, the second measured 2.5x1.5x0.7 cm partially covered by skin ellipse 2.3 cm. Both were totally embedded.

PHOTOGRAPH

MICROSCOPIC:

Sections from both submitted fragments show benign non-capsulated dermal tumor formed of storiform bundles of proliferating myofibroblasts. Skin is acanthotic. No evidence of malignancy and excision of lesion looks complete.

DIAGNOSIS:

Lower back mass, excision:

- Dermatofibroma.
- Negative for malignancy.
