## PATHOLOGY REPORT

|                              |  |
|------------------------------|--|
| <b>Clinical Information.</b> | Complicated empyema who underwent a decortication. |
| <b>Nature of specimen.</b>   | Parietal pleura decortication.                     |

### GROSS:

Two soft tissue fragments collectively measured 2.8x2.5x0.8 cm, totally embedded.

### MICROSCOPIC:

Fibrotic pleura with extensively ulcerated mesothelium and replacement by fibrinous deposits, capillary proliferation, interstitial hemorrhage and marked infiltration by lymphocytes, plasma cells and many neutrophils, cell debris with and related dense fibrosis. No evidence of granulomatous inflammation. No evidence of malignancy.

### DIAGNOSIS:

#### Pleural decortication:

- Chronic suppurative inflammation (empyema) with fibrosis.
- Negative for granulomatous inflammation.
- Negative for malignancy.
