PATHOLOGY REPORT

Clinical Information.	Lt breast mass.
Nature of specimen.	Excision biopsy

GROSS:

Circumscribed rubbery mass received in two pieces measuring 1.8x1.5x1 cm in aggregate, showing homogenous white cut section.

MICROSCOPIC:

A benign well encapsulated tumor formed of proliferating breast ducts and stromal fibrocytes. The latter predominate in the lesion thus compressing ducts into slit-like structures. Adjacent breast tissue showing breast tissue shows preserved normal lobular pattern with stromal fibrosis and adenosis. Cytologic features are unremarkable. No evidence of malignancy.

DIAGNOSIS:

Lt. Breast mass, excision biopsy:

- Intraductal fibroadenoma.
- Fibroadenosis
- Negative for malignancy.
