<b>Referred By:</b>	د/ محمد حسين الشرقي		<b>Reported date:</b>	2026-04-22	

### PATHOLOGY REPORT

<b>Clinical Information.</b>	4-month history of a growing, ulcerated, and nodulated lesion on the lingual side of the lower jaw, with a suspected diagnosis of squamous cell carcinoma.
<b>Nature of specimen.</b>	Incisional biopsy.

#### GROSS:

Soft tissue fragment measured 0.7x0.7x0.5 cm, totally embedded.

#### MICROSCOPIC:

An exo-endophytic malignant tumor formed of broad papillary formations of hyperkeratotic squamous cells with mild atypia. Tumor show a rounded pushing than infiltrating border. However, in some foci tumor appears to be infiltrative and formed of irregular solid groups and solid nests of atypical squamous cells. Cells show mild to moderate anaplasia. Stroma shows moderate inflammatory reaction formed of lymphocytes and plasma cells.

#### DIAGNOSIS:

Lesion on the lingual side of the lower jaw, incision biopsy:

- Verrucous squamous cell carcinoma, grade 1.
