PATHOLOGY REPORT

Clinical Information.	The whole gastric mucosa is congested and hyperemic with nodular pattern.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Soft tissue fragments collectively measured 0.8 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa showing mild atrophy of glands and moderate infiltration by lymphocytes and plasma cells. Lymphocytes aggregate in some foci to form lymphoid follicles with active germinal centers. There is evidence of inflammatory activity manifested by neutrophils infiltrating glands. H. pylori characteristic forms are seen. No evidence of intestinal metaplasia, atypia or malignancy.

DIAGNOSIS:

Stomach, Endoscopic biopsy:

- H pylori associated chronic atrophic follicular gastritis with associated moderate inflammatory activity.
- Negative for dysplasia or malignancy.
