PATHOLOGY REPORT

Clinical Information.	Moderate proximal colitis localized to the cecum and ascending colon.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Soft tissue fragments collectively measured 0.4 cm, totally embedded.

MICROSCOPIC:

Intact colonic mucosa with mild reduction in the number of mucigenic cells and moderate infiltration by lymphocytes, plasma cells and neutrophils. However, crypt abscesses are not identified. No evidence of atypical or malignant cells.

DIAGNOSIS:

Colon, endoscopic biopsies:

- Moderate chronic colitis with moderate inflammatory activity.
- Negative for atypia and malignancy.
