## PATHOLOGY REPORT

Clinical Information.	Diffuse gastric erythematous mucosa.
Nature of specimen.	Endoscopic biopsy.

### GROSS:

Soft tissue fragments collectively measured

### MICROSCOPIC:

Gastric mucosa showing mild infiltration by lymphocytes and plasma cells. Some neutrophils are seen infiltrating glands indicating activity. H. pylori characteristic forms are seen colonizing glands. No evidence of intestinal metaplasia, atypia or malignancy. Since cytotoxin-producing H. pylori are capable of inducing complications, their serological detection is recommended.

### DIAGNOSIS:

#### Stomach, endoscopic biopsy:

- H. pylori-associated mild chronic gastritis with associated minimal activity.
- Negative for intestinal metaplasia
- Negative for dysplasia.
- Negative for malignancy.

### Pathologist

Prof. Dr. Neveen Tahoun, MD, PhD
