## PATHOLOGY REPORT

<b>Clinical Information.</b>	Lt. breast mass surrounded by edema.
<b>Nature of specimen.</b>	Tru-cut biopsy

### GROSS:

Tissue cores up to 1.3 cm long, totally embedded.

### MICROSCOPIC:

The core biopsy consists of skeletal muscle and fibroadipose tissue markedly infiltrated by a dense, polymorphous chronic active inflammatory population. The infiltrate is composed of lymphocytes, plasma cells, histiocytes and many neutrophils. No evidence of specific granulomas. No evidence of malignancy in submitted biopsy.

### DIAGNOSIS:

#### Left Breast Mass , core biopsy:

- Chronic suppurative inflammation with abscess formation.
- Negative for malignancy.

### COMMENT:

Given age of the patient, complete excision of the mass is recommended to avoid missing of unsampled more serious pathology.
