Pt. Age:	48 years.	Gender:	Female
Received date:		Reported date:	2026-04-26
Referred By:	د/ محمد الحميدي		

### PATHOLOGY REPORT

Clinical Information.	Guided core biopsy from hepatic focal lesions. ? Metastasis or Lymphoma.
Nature of specimen.	Referred paraffin block and slides for consultation.

#### GROSS:

Submitted one paraffin block and 2 Hx & E stained slides, coded 2155-26

#### MICROSCOPIC:

Liver parenchyma with marked infiltration of portal areas by mature lymphocytes which appear to extend in many microscopic foci to encircle degenerating hepatocytes at periphery of lobules (interface hepatitis/ piece-meal necrosis). Portal areas show moderate fibrosis with evidence of bridging fibrosis (porto-portal & zone III-portal) but no evidence of frank cirrhosis. Many bile ducts showing bile pigments denoting cholestasis. Associated moderate fatty change. No evidence of specific granulomas. No evidence of dysplasia or malignancy.

#### DIAGNOSIS:

*Hepatic focal lesion, guided core biopsy, referred paraffin block and slides for review:*

- Grade 3 chronic hepatitis with associated stage 3 fibrosis (METAVIR A2F3, Ishak: grade 7-8/18, stage 4-5/6).
- Associated cholestasis and moderate fatty change.
- Negative for granuloma, dysplasia and malignancy.

#### COMMENT:

Given clinical findings regrading presence of multiple lesions, please make sure the submitted material is representative. Otherwise rebiopsy will be recommended if malignancy is still suspicious.
