PATHOLOGY REPORT

Clinical Information.	Anterior neck swelling diagnosed as multinodular goiter.
Nature of specimen.	Total thyroidectomy.

GROSS:

Total thyroidectomy consisting of two lobes measuring 4x2x1.5 cm and 6.5x4x3.5 cm, and a 2x1 cm isthmus. The thyroid capsule is intact. Cut sections revealed multiple grey nodules, the largest measuring 5.5x3.8x3.2 cm.

MICROSCOPIC:

Thyroid gland shows nodular adenomatous hyperplasia. Nodules are variable in size and composed of small and large crowded follicles full of thick colloid and lined by mature epithelium. Sections from some of the nodules show compact microfollicles devoid of colloid and lined by cuboidal cells separated by delicate vascular stroma. In these follicles nuclei are vesicular and look active but no appreciable mitosis. Stroma shows mild fibrosis and show focal dense infiltration by lymphocytes amounting at the formation of lymphoid follicles with intact active germinal centers. Related follicles show degeneration but no evidence of oxyphil change of the follicular epithelium. No evidence of hyperfunction or malignancy.

DIAGNOSIS:

Thyroid gland, total thyroidectomy:

- Nodular adenomatous hyperplasia. .
- Associated lymphocytic thyroiditis.
- Negative for malignancy.
