PATHOLOGY REPORT

Clinical Information.	Vomiting and epigastric pain, gastroscopy revealed gastritis with a granular appearance and antral ulcers.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Soft tissue fragments collectively measured 0.6 cm, totally embedded in one cassette.

MICROSCOPIC:

Gastric mucosa showing superficial erosions and moderate glandular atrophy with moderate infiltration by lymphocytes and plasma cells. Lymphocytes aggregates in some foci forming lymphoid follicles with active germinal centres. Neutrophils are seen infiltrating glands thus indicating activity. H. pylori characteristic forms are present. Areas of intestinal metaplasia are noted, however, no evidence of atypia or malignancy.

DIAGNOSIS:

Stomach, endoscopic biopsies :

- H. pylori associated chronic atrophic erosive follicular gastritis with moderate inflammatory activity and areas of intestinal metaplasia.
- Negative for dysplasia or malignancy
