## PATHOLOGY REPORT

<b>Clinical Information.</b>	Abnormally thickened gastric mucosa.
<b>Nature of specimen.</b>	Endoscopic biopsies.

### GROSS:

Two biopsies were received:

- 1- Pylorus: soft tissue fragments collectively measured 0.5 cm, totally embedded.
- 2- Funded: soft tissue fragments collectively measured 0.7 cm, totally embedded.

### MICROSCOPIC:

Gastric mucosa from both sites showing mild atrophy of glands and moderate infiltration by lymphocytes and plasma cells. There is evidence of inflammatory activity manifested by some neutrophils infiltrating glands. H. pylori characteristic forms are not identified. No evidence of intestinal metaplasia, atypia or malignancy in submitted material.

### DIAGNOSIS:

#### ***Stomach, Endoscopic biopsies:***

- Moderate chronic atrophic gastritis with associated mild inflammatory activity.
- H pylori is not identified.
- Negative for atypia and malignancy.
