PATHOLOGY REPORT

Clinical Information.	Gastroscopy: the entire gastric mucosa was moderate hyperemic and congested mucosa with nodularity mostly in the antrum and prepyloric.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Soft tissue fragments collectively measured 0.6 cm, totally embedded in one cassette.

MICROSCOPIC:

Gastric mucosa showing mild atrophy and moderate infiltration by lymphocytes and plasma cells. Lymphocytes aggregate in some foci to form lymphoid follicles with active germinal centers. Neutrophils are seen infiltrating glands thus indicating activity. *H. pylori* characteristic forms are present. There is no evidence of intestinal metaplasia, atypia or malignancy.

DIAGNOSIS:

Stomach, endoscopic biopsies :

- *H. pylori* associated chronic follicular atrophic gastritis with moderate inflammatory activity.
- Negative for intestinal metaplasia, dysplasia or malignancy .
