

Pt. Name:	ياسر قاسم أحمد علي		Lab Number:	2656-2026	
Pt. Age:	36 years.	Gender:	Male	Received date:	2026-04-25
Referred By:	د/ أحمد الأشول		Reported date:	2026-04-30	

PATHOLOGY REPORT

Clinical Information.	The patient presented with swelling in the left body of the mandible caused by a well-demarcated, buccolingually destructive lesion that yielded a bloody aspirate, prompting surgical excision of the cyst and extraction of the associated third and seventh molar teeth.
Nature of specimen.	Excision biopsy.

GROSS:

Two soft tissue pieces collectively measured 2.5x2x0.5 cm, with associated two teeth.

MICROSCOPIC:

Cystic tumor lined by proliferating ameloblasts exhibiting peripheral palisading of nuclei and central stellate loose reticulum. Wall show few nested structures with the same arrangement of cells. Fragments of unremarkable surface epithelium are also seen. No evidence of malignancy.

DIAGNOSIS:

Lt. Mandibular cystic swelling, excision biopsy:

- Ameloblastoma, cystic variant.
- Negative for malignancy.

COMMENT:

This is a locally invasive tumor with liability for local recurrence (which may be delayed) if not adequately excised.
