## PATHOLOGY REPORT

<b>Clinical Information.</b>	Chronic active nodular gastritis with bile reflux, chronic ulcerative duodenitis, left-sided predominant erosive colitis.
<b>Nature of specimen.</b>	Endoscopic biopsies.

### GROSS:

Three biopsies were received:

- 1- Gastric: soft tissue fragments collectively measured 0.6 cm, totally embedded.
- 2- Duodenal: soft tissue fragments collectively measured 0.7 cm, totally embedded.
- 3- Colonic: soft tissue fragments collectively measured 0.7 cm, totally embedded.

### MICROSCOPIC:

- 1-Gastric mucosa showing superficial erosions and moderate infiltration by lymphocytes and plasma cells. There is evidence of inflammatory activity manifested by some neutrophils infiltrating glands. *H. pylori* characteristic forms are not identified. No evidence of intestinal metaplasia, atypia or malignancy.
- 2-Duodenal mucosa showing moderate infiltration by lymphocytes and plasma cells. Villi are intact and are negative for atrophy and ulceration. No evidence of specific granulomas. No evidence of malignancy.
- 3-Intact colonic mucosa with mild reduction in the number of mucigenic cells and moderate infiltration by lymphocytes, plasma cells and neutrophils. However, crypt abscesses are not identified. No evidence of atypical or malignant cells.

### DIAGNOSIS:

#### Stomach, Endoscopic biopsy:

- Moderate chronic active gastritis with erosions
- *H pylori* is not identified.
- Negative for dysplasia or malignancy.

#### Duodenum, Endoscopic biopsy:

- Moderate chronic non-specific inflammation.
- Negative for villous atrophy.
- Negative for atypia or malignancy.

#### Colon, endoscopic biopsy:

- Moderate chronic colitis with moderate inflammatory activity.
- Negative for atypia and malignancy.
