### PATHOLOGY REPORT

<b>Clinical Information.</b>	Cervical lymphadenopathy.
<b>Nature of specimen.</b>	Excision biopsy.

#### GROSS:

Lymph node measured 1.7x1.3x1 cm, totally embedded.

#### MICROSCOPIC:

Lymph node shows complete loss of the normal nodal pattern and incomplete division into nodules. Nodules are formed of a rather monomorphic population of activated small lymphocytes with scattered histiocytes as well as mono, bi and multinucleated giant cells with popcorn nuclei and small nucleoli. Picture is consistent with lymphoma, possibly Hodgkin's lymphoma. Confirmatory marker study (CD15, CD30, EMA, MUM1, CD20 & CD3 markers) is recommended.

#### DIAGNOSIS:

##### Cervical lymph node excision biopsy:

- Atypical lymphoid infiltrate, consistent with lymphoma.
- Recommended for confirmation and definitive subtyping by marker study.
