## PATHOLOGY REPORT

<b>Clinical Information.</b>	Gastric erythema and erosions.
<b>Nature of specimen.</b>	Endoscopic biopsies.

### GROSS:

Soft tissue fragments collectively measured 0.5 cm, totally embedded in one cassette.

### MICROSCOPIC:

Gastric mucosa body type showing superficial erosions and moderate infiltration by lymphocytes and plasma cells. Lymphocytes aggregate in some foci to form lymphoid follicles with active germinal centers. Neutrophils are seen infiltrating glands thus indicating activity. *H. pylori* characteristic forms are seen colonizing glands. No evidence of intestinal metaplasia, atypia or malignancy.

### DIAGNOSIS:

#### Stomach, endoscopic biopsy:

- *H. pylori*-associated chronic erosive follicular gastritis with moderate inflammatory activity.
- Negative for atypia and malignancy.
