### PATHOLOGY REPORT

Clinical Information.	Rt. parotid gland soft tissue lesion.
Nature of specimen.	Excision biopsy.

#### GROSS:

Received is a single soft tissue mass measuring 5.5x5x4.3 cm. Sectioning revealed a gray myxoid cut section.

#### MICROSCOPIC:

A multinodular and partly encapsulated tumor of parotid gland, nodules are formed of myxoid stroma with stellate cells and chondroid areas. Periphery of nodules show proliferating ductal and myoepithelial cells arranged in solid groups, small trabeculae and ductal formation. No evidence of malignancy.

#### DIAGNOSIS:

##### Parotid gland mass:

- Myxoid variant of pleomorphic adenoma.
- Negative for malignancy.

#### COMMENT:

Due to multinodularity and partial encapsulation, local recurrence may occur.
