PATHOLOGY REPORT

Clinical Information.	Severe nodular antral gastropathy with linear erosions; and colonic biopsies to rule out IBD.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Two biopsies were received:

- 1- Gastric: soft tissue fragments collectively measured 0.6 cm, totally embedded.
- 2- Colonic' soft tissue fragments collectively measured 1 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa e showing superficial erosions with mild glandular atrophy and moderate infiltration by lymphocytes and plasma cells. Neutrophils are seen infiltrating glands thus indicating activity. *H. pylori* characteristic forms are seen colonizing glands. No evidence of intestinal metaplasia, atypia or malignancy.

Intact colonic mucosa with mild reduction in the number of mucigenic cells and mild infiltration by lymphocytes, plasma cells and neutrophils. However, crypt abscesses are not identified. No evidence of atypical or malignant cells.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- *H. pylori*-associated chronic atrophic erosive gastritis with mild inflammatory activity.
- Negative for atypia and malignancy.

Colonoscopic biopsy:

- Mild chronic colitis with associated minimal inflammatory activity.
- Negative for epithelial dysplasia.
- Negative for IBD.
- Negative for malignancy.
