PATHOLOGY REPORT

Clinical Information.	Perforated viscus; perforated small intestine.
Nature of specimen.	Biopsy

GROSS:

Small bowel biopsy: two soft tissue fragments collectively measured 1.2x0.8x0.5 cm, totally embedded.

MICROSCOPIC:

Sections from the perforated area show ulceration of small intestinal mucosa with related transmural infiltration by lymphocytes, plasma cells, macrophages, and neutrophils reaching to the serosal covering, with related vascular congestion. No evidence of specific granulomas. No evidence of malignancy.

DIAGNOSIS:

Small intestinal biopsy:

- Inflammatory perforation with related peritonitis.
- Negative for specific granulomas.
- Negative for malignancy.
