PATHOLOGY REPORT

Clinical Information.	Gastric edematous/granular mucosa with thickened peripyloric folds, and duodenal fissuring with cobblestone appearance.
Nature of specimen.	Endoscopic biopsy

GROSS:

Two biopsies were received:

1- Gastric: soft tissue fragments collectively measured 1 cm.

1- Duodenal: soft tissue fragments collectively measured 1 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa mild glandular atrophy and moderate infiltration by lymphocytes and plasma cells. Neutrophils are seen infiltrating glands thus indicating activity. H. pylori characteristic forms are seen colonizing glands. No evidence of intestinal metaplasia, atypia or malignancy.

Duodenal mucosa show focal moderate villous atrophy associated intraepithelial lymphocytosis and crypt hyperplasia malignancy with submucosal mild infiltrate of lymphocytes and plasma cells. No evidence of specific granulomas. No evidence of atypia or malignancy.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- H. pylori-associated chronic atrophic gastritis with moderate inflammatory activity.
- Negative for atypia and malignancy.

Duodenum, endoscopic biopsy:

- Focal moderate villous atrophy with associated chronic non-specific duodenitis, consistent with celiac disease. Modified Marsh-Oberhuber classification, grade 3a (Corazza & Villanacci grade B1).
- Negative for malignancy.
