Pt. Age:	13 years.	Gender:	Female
Received date:		Reported date:	2026-05-07
Referred By:	د/ عبده وادي		

### PATHOLOGY REPORT

Clinical Information.	Atrophic mucosa with a mosaic pattern and mild erythema in the stomach antrum, alongside an incompetent cardia and a duodenum characterized by atrophic folds, flattened villi, scalloping, and fissuring.
Nature of specimen.	Endoscopic biopsy

#### GROSS:

- 1- Gastric: soft tissue fragments collectively measured 1 cm, totally embedded.
- 2- Duodenal: soft tissue fragments collectively measured 1 cm, totally embedded.

#### MICROSCOPIC:

Gastric mucosa showing mild atrophy of glands and mild infiltration by lymphocytes and plasma cells. There is evidence of inflammatory activity manifested by some neutrophils infiltrating glands. *H. pylori* characteristic forms are seen. No evidence of intestinal metaplasia, atypia or malignancy.

Duodenal mucosa showing almost diffuse villous atrophy as the intestinal villi are significantly shrunken or partially flattened (moderate atrophy). The crypts (glands at the base of the villi) become deeper as the body tries to compensate for lost villi. There is a pathological increase in these lymphocytes within the epithelial lining with follicles. No evidence of specific granulomas. No evidence of atypia or malignancy.

#### DIAGNOSIS:

##### Stomach, Endoscopic biopsy:

- *H. pylori* associated chronic atrophic gastritis with associated mild inflammatory activity.
- Negative for dysplasia or malignancy.

##### Duodenum, endoscopic biopsy:

- Moderate villous atrophy, consistent with Marsh Class III (3B) according to Marsh-Oberhuber classification of celiac disease.
- Associated moderate chronic follicular non-specific inflammation.
- Negative for atypia or malignancy.

#### Pathologist
