### PATHOLOGY REPORT

Clinical Information.	Thickened endometrium with dysfunctional uterine bleeding.
Nature of specimen.	D & C biopsy.

#### GROSS:

Soft tissue fragments collectively measured 2x1.5x0.7 cm, totally embedded.

#### MICROSCOPIC:

Fragments of focally decidualized endometrial stroma with entrapped glands. The latter are disordered proliferative. The non-secretory glands are focally branching. Such changes may be produced by irregular hormone therapy or a persistent corpus luteum. Unremarkable endocervical and ectocervical epithelium is observed. No evidence of atypia or malignancy.

#### DIAGNOSIS:

##### Endometrial biopsy:

- Irregular gland-stromal maturation with stromal decidualization.
- Negative for atypia.

#### Pathologist

Prof. Dr. Neveen Tahoun, MD, PhD
