Referred By:	د/ علي سالم		Reported date:	2026-05-09	

PATHOLOGY REPORT

Clinical Information.	Perforated gangrenous gall bladder.
Nature of specimen.	Cholecystectomy.

GROSS:

Received is an open gallbladder measuring 8.5 x 3.5 cm, showing an ulcerated mucosa of and a thickened wall measuring 0.3 cm.

MICROSCOPIC:

Gallbladder wall shows marked fibrosis with extensive mucosal ulceration, transmural acute and chronic inflammatory infiltrate composed of neutrophils, lymphocytes, and plasma cells, extending into the surrounding soft tissue, with areas of gangrenous necrosis and perforation. Glands show focal cystic dilatation and are entrapped within the muscular coat (Rokitansky-Aschoff sinuses). No evidence of atypia or malignancy.

DIAGNOSIS:

Gall bladder, cholecystectomy:

- Acute gangrenous perforated cholecystitis on top of chronic cholecystitis.
- Negative for malignancy.
