PATHOLOGY REPORT

Clinical Information.	Pangastritis with gastric ulcer.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Three biopsies were received:

- 1- Gastric: soft tissue fragments collectively measured 1 cm, totally embedded.
- 2- Ileum: soft tissue fragments collectively measured 0.6 cm, totally embedded.
- 3- Colon: soft tissue fragments collectively measured 0.6 cm, totally embedded.

MICROSCOPIC:

- Gastric mucosa showing mild atrophy with superficial erosions and moderate infiltration by lymphocytes and plasma cells. Lymphocytes aggregate in some foci to form lymphoid follicles with active germinal centers. Neutrophils are seen infiltrating glands thus indicating activity. H. pylori characteristic forms are present. There is no evidence of intestinal metaplasia, atypia or malignancy.
- Ileal mucosa showing mild infiltration by lymphocytes and plasma cells with follicles. Villi are intact and are negative for atrophy and ulceration. No evidence of specific granulomas. No evidence of malignancy.
- Intact colonic mucosa mildly infiltrated by lymphocytes and plasma cells with lymphoid follicles. Mucigenic cells are intact. Some neutrophils are seen infiltrating glands but there is no evidence of crypt abscesses. No evidence of atypia or malignancy.

DIAGNOSIS:

1- Stomach, endoscopic biopsies :

- H. pylori associated chronic follicular atrophic erosive gastritis with moderate inflammatory activity.
- Negative for intestinal metaplasia, dysplasia or malignancy .

2- Ileum, endoscopic biopsy:

- Mild chronic non-specific inflammation.
- Negative for villous atrophy.
- Negative for malignancy.

3- Colon, endoscopic biopsies:

- Mild follicular colitis with minimal inflammatory activity.
- Negative for dysplasia and malignancy.
