PATHOLOGY REPORT

Clinical Information.	Epigastric pain. Upper GIT endoscopy revealed gastric erythema and congestion.
Nature of specimen.	Endoscopic biopsy.

GROSS:

Two soft tissue pieces collectively measured 0.4 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa showing moderate infiltration by lymphocytes and plasma cells. Some neutrophils are seen infiltrating glands indicating activity. H. pylori characteristic forms are seen colonizing glands. No evidence of intestinal metaplasia, atypia or malignancy. Since cytotoxin-producing H. pylori are capable of inducing complications, their serological detection is recommended.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- H. pylori-associated moderate chronic gastritis with associated minimal activity.
- Negative for intestinal metaplasia
- Negative for dysplasia.
- Negative for malignancy.
