### PATHOLOGY REPORT

Clinical Information.	Menorrhagia with adenomyosis.
Nature of specimen.	Total abdominal hysterectomy

#### GROSS:

Total abdominal hysterectomy specimen was received. The uterus measured 10 x 7 x 5 and featured a trabeculated wall with a thickness of 2.5 cm. The specimen showed five fibroid masses, the largest of which measured 2 x 2, having a solid, rubbery, and grey in color. Endometrium measured 0.5 cm with a polyp measuring 0.7 cm. The cervix measured 4 cm in length.

#### MICROSCOPIC:

Endometrial polyp and endometrium show hyperplastic endometrial glands, are non-secretory, formed of slightly branching glands lined by 1-2 layers of cells. Stroma is cellular. No evidence of complex glandular pattern. Some of the hyperplastic endometrium are seen embedded within deep myometrium. Myometrial tumors are benign leiomyoma formed of whorly bundles of mature smooth muscles separated by a fibrous stroma. No evidence of tumor necrosis. No evidence of atypia or malignancy. One of these leiomyomas are seen entrapping benign endometrial glands and stroma with cystic dilatation consistent with adenomyomas. Cervix shows Nabothian cysts and mild endocervicitis with squamous metaplasia.

#### DIAGNOSIS:

##### Total hysterectomy:

- Mild simple endometrial hyperplasia without atypia
- Hyperplastic endometrial polyp
- Deep adenomyosis
- Leiomyomas + one adenomyoma
- Cervical Nabothian cysts and mild endocervicitis and squamous metaplasia.
- Negative for malignancy.

#### Pathologist

Prof. Dr. Neveen Tahoun, MD, PhD
