PATHOLOGY REPORT

Clinical Information.	Pangastritis with mild sigmoiditis and sigmoid diverticula.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Two biopsies were received:

- 1- Gastric: two soft tissue fragments collectively measured 0.4 cm, totally embedded.
- 2- Colonic: soft tissue fragments collectively measured 0.5 cm, totally embedded.

MICROSCOPIC:

- Gastric mucosa showing moderate infiltration by lymphocytes and plasma cells. There is evidence of inflammatory activity manifested by some neutrophils infiltrating glands. *H. pylori* characteristic forms are seen. Focal intestinal metaplasia is noted, however there is no evidence of atypia or malignancy.
- Intact colonic mucosa moderately infiltrated by lymphocytes and plasma cells. Mucigenic cells are mildly decreased. Some neutrophils are seen infiltrating glands but there is no evidence of crypt abscesses. No evidence of atypia or malignancy.

DIAGNOSIS:

Stomach, Endoscopic biopsy:

- *H. pylori* associated chronic gastritis with associated mild inflammatory activity and focal intestinal metaplasia.
- Negative for dysplasia or malignancy.

Colon, endoscopic biopsy:

- Moderate chronic colitis with mild inflammatory activity.
- Negative for dysplasia and malignancy.
