Referred By:	د/ مهند السالم		

PATHOLOGY REPORT

Clinical Information.	History of chronic diarrhea with iron deficiency anemia and weight of loss. Duodenal endoscopic biopsy to rule out celiac disease.
Nature of specimen.	Duodenal endoscopic biopsy.

GROSS:

Fragments of collective size 6x5 mm.

MICROSCOPIC:

Duodenal mucosa showing almost diffuse villous atrophy as the intestinal villi are significantly shrunken or partially flattened (moderate/marked atrophy). The crypts (glands at the base of the villi) become deeper as the body tries to compensate for lost villi. There is a pathological increase in these lymphocytes within the epithelial lining. No evidence of specific granulomas. No evidence of atypia or malignancy.

DIAGNOSIS:

Duodenum, Biopsy:

- Marker villous atrophy, consistent with Marsh Class 3B according to Marsh-Oberhuber classification of celiac disease.
- Associated moderate chronic non-specific inflammation.
- Negative for atypia or malignancy.
